01 Platform Overview

TradeX Terminal is a professional-grade, AI-powered multi-asset trading intelligence platform. It uses a 7-agent debate system where specialist AI agents independently analyze price action, news, risk, and structure — then debate each other before a Master Agent renders a final verdict.

What TradeX Does

- Analyzes XAU/USD, EUR/USD, GBP/USD, and BTC/USD
- Runs 7 independent AI agents per analysis
- Detects Break of Structure, CHoCH, liquidity sweeps
- Anchors conviction to 20-day daily trend (not just today's candle)
- Provides entry, stop-loss, and take-profit levels
- Monitors live news, geopolitical events, and economic data

Key Differentiators

- **D1 Anchoring:** Conviction uses 20-day drift — not just today's ±%
- **7-Agent Debate:** Agents challenge each other before final decision
- **News Filtering:** Irrelevant headlines removed before AI analysis
- **Weighted Voting:** HIGH-impact events outweigh neutral noise
- **Visual Command Room:** Agent states shown as interactive pixel art
- **Risk Gate:** Hard block on poor-session or high-volatility trades

⚠ **Important:** TradeX provides analytical intelligence, not financial advice. All signals are tools to inform — not replace — your own risk management and trading decisions.

02 Navigation & Layout

The sidebar on the left provides access to all modules. On smaller screens, navigation collapses to a bottom tab bar. The sidebar can be hidden to maximize workspace.

PAGE	ICON	PURPOSE	BEST USED FOR
Dashboard	⊞	Live price quotes, AI briefing overview, quick session view	Morning scan, quick market check
Brain Terminal	🧠	7-agent AI analysis engine (core feature)	Full trade setup analysis
Market Bias	◎	HTF bias per asset with conviction score	Bias alignment check
Asset Matrix	⊠	Correlated assets, macro regime snapshot	Inter-market analysis
Catalysts	⚡	Live news, economic events, live TV streams	Pre-news awareness
Economic Calendar	📅	Scheduled high-impact economic releases	Avoiding news traps
Trump Monitor	👤	Political statement tracker affecting markets	Gold/USD macro awareness
Session Intelligence	🕐	Active session, optimal trade windows	Timing entries correctly
News Flow	📰	Real-time financial news aggregator	Staying informed intraday
PnL Calendar	📊	Trade history and performance tracking	Performance review
Signal History	📋	Archive of all Brain Terminal signals	Backtesting agent accuracy
Settings	⚙	API keys, preferences, theme	Initial setup

💡 **Pro tip:** The Brain Terminal (🧠) is the core of the platform. Start there every session. Use other pages to provide additional context before committing to a trade.

03 Brain Terminal — Core Feature

The Brain Terminal is the central intelligence hub. It orchestrates 7 AI agents, runs a structured debate, and delivers a Master Decision with confidence score, consensus score, entry/exit levels, and a visual command room.

Layout at a Glance

ZONE	WHAT YOU SEE	WHAT IT MEANS
Header Bar	Symbol selector (XAU/USD etc.), Timeframe (M15/H1/H4), Sniper mode, Refresh	Controls what the agents analyze
Master Consensus Bar	LONG/SHORT/NO TRADE in large text, Confidence %, Consensus Score, Candle countdown	The final AI verdict — the only number that matters for direction
Pixel Command Room	Visual command room with 7 colored agent pins	At-a-glance signal state for all agents
Agent Cards (Row 1)	Trend · Price Action · News · Risk Gate	Independent analysis from 4 specialist agents
Agent Cards (Row 2)	Contrarian · Execution Agent · Master Agent	Execution setup, counter-signals, and final verdict card
Pixel View Matrix	Compact 7-row table of all agents	Quick scan of all states and key metrics at once

Master Consensus Bar — Reading the Numbers

CONFIDENCE %

How certain the Master Agent is.
≥70% = high conviction trade
50–69% = moderate, tighten size
<50% = stand aside

CONSENSUS SCORE

Range: −100 to +100
+40 and above = strong bullish alignment
−40 and below = strong bearish alignment
Within ±20 = mixed — no trade

CANDLE COUNTDOWN

Time remaining in the current candle. Useful for timing entries — wait for a candle close to confirm structure before executing.

Pixel Command Room

The visual command room shows each of the 7 agents as interactive pin characters positioned on a trading floor background. Each pin glows with the agent's current signal color:

- **Green** — BULLISH / VALID
- **Red** — BEARISH / BLOCKED
- **Cyan** — ARMED (ready)
- **Amber** — ALERT / NEUTRAL
- **Blue** — ANALYZING
- **Dim** — IDLE (no signal)

Clicking any agent pin opens that agent's full detail drawer showing all data, reasons, and indicators.

💡 **Ideal setup:** When Trend, Price Action, and Master all glow RED simultaneously → strong bearish consensus. When Risk Gate is GREEN (approved) and Execution is CYAN (armed) → setup is ready to execute.

Sniper Mode

Click the `SNIPER` button in the header to enable Sniper Mode. In this mode, only setups with the highest conviction scores and strict execution criteria are surfaced — filtering out marginal signals.

Refresh vs Cache

CACHED BADGE

The data is from the last analysis run (max 5 minutes old). This is normal — agents cache to save API calls and processing time.

MANUAL REFRESH

Click **Refresh** to force a fresh analysis run. Use before making any trade decision to ensure you have the most current data.

04 7-Agent System — Deep Dive

Each agent operates independently, analyzing a different dimension of the market. They then debate each other, and the Master Agent adjudicates. Click any agent card or pin to open its full detail drawer.

AGENT 01

Trend Agent

Macro Bias Analyst

Determines the dominant trend using multi-timeframe candle data (M5, M15, H1, H4). Checks for Higher Highs/Lows (bullish) or Lower Highs/Lows (bearish). Also computes EMA 20/50/200 stack and RSI momentum. **D1 anchored** — uses 20-day daily drift as the primary HTF signal.

AGENT 02

Price Action Agent

Structure Analyst

Detects Smart Money Concepts: Break of Structure (BOS), Change of Character (CHoCH), liquidity sweeps, order blocks, and Fair Value Gaps. Determines if price is in a premium or discount zone relative to the equilibrium. Provides setup type and invalidation level.

AGENT 03

News Agent

Fundamentals Analyst

Filters market-relevant news (removes entertainment/non-financial noise), classifies macro regime (geopolitical, fed-policy, inflation, tariff), and applies weighted voting — HIGH-impact events (3×) dominate over neutral noise. Iran/Hormuz conflicts always trigger BULLISH for gold.

AGENT 04

Risk Gate

Risk Management Agent

Acts as a hard gatekeeper. Evaluates session quality (London = 90/100, NY = 80/100, Asia = 40/100), volatility, spread conditions, and overall trade grade (A–F). If Risk Gate is BLOCKED (red), all other bullish signals are overridden — no trade.

AGENT 05

Execution Agent

Entry Timing Agent

Calculates the precise entry price, stop-loss, TP1, and TP2 levels. Computes the Risk:Reward ratio. Signal states: WATCHING (scanning) → ARMED (conditions met, entry imminent) → NO TRADE (conditions not met). Only executes when RR ≥ 1.5.

AGENT 06

Contrarian Agent

Counter-Signal Analyst

Actively looks for reasons NOT to take the trade. Identifies bull/bear traps, overextended moves, liquidity voids, and Asia session false moves. Issues ALERT when it has high conviction the majority bias is wrong. Acts as a devil's advocate — keep it in view.

AGENT 07 · MASTER

Master Agent — Chief Market Officer

Final Decision Arbiter

Receives all 6 agent outputs, observes the inter-agent debate, and renders the final verdict. Uses a weighted consensus score (−100 to +100) gated through structure checks (BOS must confirm direction), Risk Gate status, Fibonacci confluence, and overall evidence quality. The Master Agent is the only output you need to act on.

BULLISH	Long bias — look for entries on pullbacks to support
BEARISH	Short bias — look for entries at resistance rejections
NO TRADE	Insufficient consensus — stay out of the market

The Debate System

After all 6 specialist agents complete their independent analysis, a **Debate Phase** runs where agents with disagreeing views issue direct challenges to each other. The Master Agent adjudicates after reading the full debate. This prevents any single agent from dominating and forces the system to account for conflicting evidence.

⚠️ **When agents disagree:** If the Contrarian Agent is BLOCKED (red) while Master is BULLISH — treat the trade with extra caution. Reduce position size or wait for a cleaner setup.

Agent Detail Drawer

Click any agent card, pin, or row in the Pixel View matrix to open its full detail drawer. The drawer shows:

- Full reasoning (bullet points from the AI)
- All timeframe biases (M5/M15/H1/H4)
- Key indicator values (RSI, MACD, ATR)
- Invalidation level — where the thesis breaks
- Entry / SL / TP levels (Execution Agent)
- Cached data age and last update time

05 Market Bias Page

The Market Bias page provides a quick, asset-by-asset HTF directional bias summary across all 4 supported pairs. Useful for a fast morning scan before going into the Brain Terminal for deeper analysis.

What You See

- **HTF Bias:** Bullish / Bearish / Neutral per asset
- **Conviction %:** How strong the bias is (0–100)
- **SMC Context:** BOS, zone, 52w position summary
- **Key Levels:** Support, resistance, equilibrium
- **Data Age Bar:** How fresh the analysis is

How to Use It

- Check in the morning — gives you bias alignment across all assets
- If XAU/USD shows BEARISH at 75%+, look for short setups in Brain Terminal
- If EUR/USD is also showing BEARISH — DXY strengthening, confirms gold short
- Conviction below 50% = no clear edge, skip that asset for the session

💡 **Inter-market confirmation:** EUR/USD is inversely correlated to DXY. If EUR/USD shows BEARISH bias, that means the USD is strong → which is generally BEARISH for Gold. Use this cross-confirmation before trading.

06 Asset Matrix

The Asset Matrix shows all 4 assets side-by-side with live price, daily change, and key metrics — plus a correlation matrix and macro regime summary.

Correlation Matrix (Key Relationships)

PAIR	CORRELATION	TRADING IMPLICATION
Gold ↔ DXY	**−0.82 (strong inverse)**	USD weakness = gold goes up. USD strength = gold under pressure.
Gold ↔ US10Y Yields	**−0.65 (inverse)**	Rising yields = bearish for gold. Rate cut expectations = bullish for gold.
DXY ↔ EUR/USD	**−0.97 (near perfect inverse)**	EUR/USD falling = USD strengthening = potential gold headwind.
SPX ↔ VIX	**−0.88 (strong inverse)**	Rising VIX = risk-off = gold and safe-haven demand increases.
BTC ↔ NDX	**+0.62 (moderate)**	Bitcoin follows risk appetite; bearish when equity risk-off kicks in.

Macro Regime Indicators

Risk Sentiment

Risk-Off = safe-haven bid (gold up, BTC uncertain). Risk-On = equities and crypto favor growth.

Rate Regime

Dovish Pivot (rate cuts expected) = bullish for gold and BTC. Hawkish = bearish for both.

USD Regime

Weakening USD = all USD-denominated commodities rise (gold, oil). Strong USD = headwind.

07 Session Intelligence

Markets don't move uniformly across all 24 hours. Session Intelligence shows which trading session is currently active and how suitable it is for trading.

SESSION	UTC HOURS	SCORE	CHARACTERISTICS	BEST FOR
London	08:00–13:00	**90/100**	Highest institutional volume, strong directional moves, tight spreads	All trade types — preferred session
New York	13:00–21:00	**80/100**	High volume, London/NY overlap (13–17 UTC) is the most liquid period	Momentum trades, news plays
Asia	00:00–08:00	**40/100**	Lower liquidity, accumulation phase, false moves common	Avoid entries — wait for London
Closed	21:00–00:00	**20/100**	Minimal volume, wide spreads, gaps possible	Do not trade

⚠️ **Asia session trap:** The Contrarian Agent specifically flags moves during the Asia session as potential traps. Prices often reverse when London opens. Always wait for London confirmation before acting on an Asia move.

08 News Flow & Catalysts

The Catalysts page and News Flow page give you real-time awareness of market-moving events. The Brain Terminal's News Agent automatically reads and filters this data — but reviewing it manually gives you additional context.

Catalysts Page

- **Live Catalysts:** Events actively moving the market right now
- **Economic Events:** Scheduled releases (NFP, CPI, FOMC)
- **Live TV Streams:** Bloomberg, CNBC, Reuters, Al Jazeera
- **News Feed:** Filtered financial headlines in real-time
- **Live Ticker:** Scrolling headline bar at top

How News Affects Gold (Key Rules)

- **Bullish for Gold:** Iran conflict, military escalation, Hormuz closure, rate cuts, dollar weakness, banking crisis, safe-haven demand
- **Bearish for Gold:** Ceasefire, peace deal, Fed rate hike surprise, strong USD, risk-on equity surge
- **Watch:** FOMC minutes, Powell speeches, CPI surprises — can flip gold bias quickly

🚫 **Avoid trading 30 minutes before/after** high-impact releases (NFP, CPI, FOMC). The economic calendar will flag these as HIGH impact. Risk Gate will automatically score lower during these windows.

09 Economic Calendar

Shows all scheduled economic releases sorted by impact level. Essential for avoiding news traps and planning your trading window.

IMPACT LEVEL	EXAMPLES	ACTION
HIGH	NFP, CPI, FOMC, GDP	Avoid entries ±30 min
MEDIUM	PMI, Retail Sales, PPI	Reduce size, widen SL
LOW	Building permits, minor data	Usually ignorable

FILTER BY DATE

Use the date filter at the top of the Economic Calendar to jump to a specific day. This lets you plan your trading week by seeing what high-impact events are scheduled ahead of time.

10 Trump Monitor

Tracks political statements and social media posts that have a documented history of moving financial markets — particularly gold, USD, and equity indices. Trump tariff announcements and geopolitical statements frequently cause immediate gold spikes.

WHY IT MATTERS FOR GOLD

Trump tariff threats → risk-off → **gold up**
Trade deal announcements → risk-on → **gold pressure**
Dollar-weakening statements → **gold up**
Fed criticism (dovish pressure) → **gold up**

HOW TO USE IT

Monitor this page before US market open (13:00 UTC). A major political statement in the morning can move gold 50–100 pips within minutes. If a statement appears that aligns with your Brain Terminal signal → higher conviction.

11 Signal History & PnL Calendar

Signal History

Archives every Brain Terminal analysis run with the full agent consensus, bias, confidence score, and entry levels. Use this to:

- Review past signal accuracy over time
- Identify which conditions produce the best signals
- Track how often the Master Agent is correct at different confidence levels
- Compare today's context to historical similar setups

PnL Calendar

Visual calendar showing your trade performance day-by-day. Helps you identify:

- Which sessions you perform best in
- Overtrading days (too many entries)
- Drawdown streaks that indicate a strategy mismatch
- Monthly performance trends

💡 If you have 3+ consecutive losing days, stop trading and re-examine your bias alignment with the Brain Terminal before resuming.

12 Complete Trading Workflow

This is the recommended step-by-step process for using TradeX Terminal to arrive at a trade decision. Follow this sequence every session.

1. **Morning Scan — Session & Calendar Check (5 min)**
   Open **Session Intelligence** — confirm you're in London or NY session (score ≥ 80). Open **Economic Calendar** — flag any HIGH-impact events in the next 4 hours. If a HIGH event is within 30 minutes, wait. Check **Trump Monitor** for any recent geopolitical statements.

2. **Macro Bias Check — Market Bias & Asset Matrix (3 min)**
   Open **Market Bias** and note the HTF bias for your intended asset. If trading gold, also check EUR/USD bias (inverse correlation). Open **Asset Matrix** to see the macro regime. If the regime is "Risk-Off + Geopolitical + Weakening USD" → strong tailwind for gold longs.

3. **News Awareness — Catalysts & News Flow (3 min)**
   Open **Catalysts** and scan active catalysts for your asset. Are there geopolitical events (bullish gold) or risk-on headlines (bearish gold)? Note the dominant macro narrative. This context will match (or contradict) what the News Agent reports in the Brain Terminal.

4. **Brain Terminal Analysis — Select Asset & Timeframe**
   Open **Brain Terminal**. Select your asset (e.g., XAU/USD) and timeframe (H1 recommended for swing, M15 for intraday). Click **Refresh** to force a fresh analysis. Wait for all 7 agents to complete their analysis (usually 15–30 seconds).

5. **Read the Pixel Command Room — At-a-Glance Check**
   Look at the command room pin colors. For a valid short setup you want to see: Trend (red) + PA (red) + Master (red) + Risk (green) + Execution (cyan). If most are amber or mixed — no trade setup yet. The visual unanimity of reds or greens is the fastest signal.

6. **Master Consensus Bar — Validate the Signal**
   Check: **Direction** (LONG/SHORT/NO TRADE) · **Confidence ≥ 70%** (minimum for trade consideration) · **Consensus Score ≥ ±40** (confirms majority alignment). If any of these thresholds aren't met, stand aside regardless of how good the candle looks.

7. **Click Each Agent Card — Verify the Full Picture**
   Open the **Trend Agent** drawer: check TF sync (M5+H1+H4 aligned?), invalidation level. Open **Price Action Agent**: BOS confirmed? Zone (Premium/Discount)? Open **Risk Gate**: Grade A or B? Session score ≥ 60? Open **Contrarian Agent**: Is it CLEAR or ALERT? If ALERT — read its reasons carefully.

8 **Execution Agent — Get Your Trade Levels**

Open the **Execution Agent** drawer. If Signal State is `ARMED` — the setup is live. Note: Entry price, Stop-Loss level, TP1 and TP2, and Risk:Reward ratio. Only accept trades with **RR ≥ 1.5:1** (ideally 2:1 or better). If signal is WATCHING — wait for ARMED state before entering.

9 **Final Cross-Check — Everything Must Align**

Before executing, run this mental checklist:

✓ Session score ≥ 80 (London or NY)
✓ No HIGH-impact news in next 30 min
✓ Master confidence ≥ 70%, consensus ≥ ±40
✓ Risk Gate VALID (green)
✓ Execution signal ARMED (cyan)
✓ RR ratio ≥ 1.5:1
✓ Contrarian Agent CLEAR or low trap confidence
✗ If any box fails → NO TRADE

10 **Execute & Monitor — Log in PnL Calendar**

Place the trade using the Brain Terminal's levels. Set your SL at the Execution Agent's stop-loss and TP at TP1 first (take partial profits). Move SL to break-even after TP1 hit. After the trade closes, log the outcome in the **PnL Calendar** for performance tracking.

Quick Signal Cheat Sheet

WHAT YOU SEE	WHAT IT MEANS	ACTION
Master: `BULLISH` · Conf 78% · Score +52	Strong buy signal, agents aligned	**Look for long entry at support**
Master: `BEARISH` · Conf 72% · Score −48	Strong sell signal, majority bearish	**Look for short entry at resistance**
Master: NO TRADE · Conf 45%	Mixed signals, no clear edge	Stand aside — wait for clarity
Risk Gate: `BLOCKED`	Conditions unfavorable (Asia session, high spread, pre-news)	Do not trade regardless of bias
Contrarian: `ALERT` (60%+ trap confidence)	High probability of a trap setup	Reduce size or skip the trade
Execution: `ARMED` + RR 2.1:1	Entry conditions met, good risk:reward	**Execute with full size**
Execution: WATCHING	Setup developing but not confirmed	Monitor — do not enter yet
All agents: Majority amber (alert)	Conflicting or low-conviction environment	No trade — wait for session transition

Timeframe Selection Guide

M15 (15-MINUTE)

Best for **scalping** and intraday quick trades. Faster signals, smaller RR ratios typically. Requires more active monitoring. Use during London/NY overlap (13:00–17:00 UTC).

H1 (1-HOUR) ← RECOMMENDED

Best for **intraday swing trades**. Good balance of signal quality and trade duration. Entry held for hours. Provides the most reliable agent consensus in typical market conditions.

H4 (4-HOUR)

Best for **multi-day position trades**. Fewer signals, higher quality. Requires wider stop-losses. Best used when the D1 trend is very clear and you want to ride a larger move.

GL Glossary of Terms

TERM	DEFINITION
BOS	Break of Structure — price closes beyond the last swing high/low, confirming a structural shift
CHoCH	Change of Character — early signal of potential trend reversal before full BOS
HTF	Higher TimeFrame — the dominant trend from D1/H4 that all LTF signals must align with
LTF	Lower TimeFrame — M5/M15/H1 used for precise entries within the HTF bias
Liquidity Sweep	Price temporarily breaks a key level (sweeping stop-losses) before reversing — often a trap
Premium Zone	Price is above equilibrium — expensive area, look for shorts or avoid longs
Discount Zone	Price is below equilibrium — value area, look for longs or avoid shorts
Equilibrium	Midpoint of the 20-period structural range — fair value price

TERM	DEFINITION
D1 Drift	20-day % change in price — used by TradeX as the primary trend conviction input
RSI	Relative Strength Index — momentum indicator. Above 70 = overbought, below 30 = oversold
MACD Hist	MACD histogram — positive = expanding bullish momentum, negative = bearish
ATR Proxy	Approximate Average True Range — measures volatility. High = wider stops needed
Consensus Score	Weighted sum of all agent votes, −100 to +100. Used to determine final bias direction
RR Ratio	Risk:Reward — e.g., 2.0:1 means you risk 1 to make 2. Minimum acceptable: 1.5:1
ARMED	Execution Agent state meaning all entry conditions are met — trade is ready to place
Risk Gate	Hard block that prevents trading when session quality, volatility, or news conditions are poor
